Today someone shared this chart, generated by the *Financial Times*. Try to pick out which one of these countries hasn't implemented a vaccine passport system:

New confirmed cases of Covid-19 in Austria, Belgium, Netherlands, Greece, Ireland and Sweden

Seven-day rolling average of new cases (per 100k)

I'll bet you know which one it is.

Meanwhile, parts of Europe are going back into lockdown. Austria is locking down the one-third of the population that is unvaccinated. The Netherlands is 72% fully vaccinated and is going into lockdown for everyone, vaccinated and unvaccinated.

Wouldn't it be nice if, instead of inanely blaming "the unvaccinated" for this, the robots on social media would at least admit that this isn't how they expected it to go, and that there shouldn't be this level of cases and deaths after the introduction of vaccines?

It's like Sweden: we were supposed to believe that Sweden would have one of the worst death rates in the world because it ignored the so-called experts demanding lockdown. Well, Sweden is currently #53 in the world for COVID death rate. Number fifty-three. Not one. Not two. Not ten. Not twenty. Fifty-three.

The crazies are still criticizing Sweden, naturally. But my question is: when you were screaming hysterically at Sweden to lock down, did you think they'd end up all the way down at number 53 in the world in death rate? Aren't you the least bit curious about that? Is there a chance that if we hadn't wrecked societies it wouldn't have made any difference anyway?
